I would like to redesign my partner's artist portfolio website, adding in several features it currently does not use. These features, like better automatic slideshows that deploy using jQuery, would make for a more streamlined website that still appears to be a single page but contains the elements of multiple pages. Being able to switch from the TOS page to the pricing page to a gallery by pressing buttons at the top of the screen would be much more efficient than constantly scrolling up and down the screen as on the original version of the site.

Adding links to videos and turnaround renders of characters would be beneficial as well.

The current design of the website is very scrolling-heavy: they are all on the same page and to get to any of them you must either scroll all the way back up or keep scrolling down.

Keeping the buttons for relevant parts of the site visible on screen would improve the UX, and condensing the gallery into a proper slideshow would help with site legibility.
